Abstract of JP 5096018 (A)

PURPOSE:To provide the probe for a laser treating device for accelerating the secretion of mother's milk which does not require holding with hand, can simultaneously irradiate the multiple points in the respective parts of the breast with laser beams and is provided with a safety device to obviate the erroneous irradiation of the eyeballs.

CONSTITUTION:This probe is constituted of plural pieces of laser diodes 4 for irradiating the skin surface with the laser beams and a cup-shaped case 3 fixed and mounted with these laser diodes 4 on the hemispherical inside surface in such a manner that the laser diodes face the inner side thereof. A suction port 5 for sucking the air in the cup-shaped case 3 is provided in the cup-shaped case 3 and further, a pressure sensor 7 for detecting the pressure in the case is provided in the cup-shaped case 3.
